

AI Website Analyzer Platform

Project Overview

The AI Website Analyzer Platform helps organizations evaluate website quality using SEO, GEO, AEO, accessibility, and performance metrics. The platform crawls websites, extracts metadata, analyzes content quality, and generates optimization recommendations.

Project Information

Project Name: AI Website Analyzer Platform

Client: Internal Enterprise Team

Technology: Python, FastAPI, React, PostgreSQL, Qdrant, Docker, Groq LLM, Playwright

Development Team

Student: Nishant Roy

Roll Number: 2301020542

Role: AI Pipeline & Document Processing

Modules

- Website Crawler
- Dynamic Content Analyzer
- SEO & Metadata Analyzer
- AI Recommendation Engine
- Document Processing Pipeline
- Enterprise Chatbot

Functional Requirements

The system should accept website URLs, crawl multiple pages, extract metadata, evaluate page performance, detect SEO issues, and generate AI-powered improvement suggestions.

Testing Checklist

1. Validate URL input.
2. Crawl website successfully.
3. Generate SEO report.
4. Produce AI recommendations.
5. Save report in Markdown and PDF formats.

Sample Policies

Security Policy

Only authenticated internal users may access analysis reports.

Data Retention

Generated reports are retained for 90 days unless deleted by administrators.

Quality Assurance

Every report must pass validation before publication.

Conclusion

This document is intended to test document extraction, LLM sanitization, heading detection, bullet preservation, and Markdown generation using the document-processing pipeline.
